Abstract

An apparatus (10) for generating an encrypted data stream representing an audio and/or video signal comprises an encoder (16) for encoding an input signal (12) to generate a data stream with a predefined data stream syntax as output signal. The apparatus further comprises an coupled with the decoder encryption means (18)order to influence encoder internal data (20a) and/or the output signal (20b) of the encoder in a uniquely reversible manner based on a key such that the generated encrypted data stream comprises payload information differing from information of a pavload data stream that generated by the apparatus without the presence of encryption means and that the generated encrypted data stream comprises the predefined data stream syntax. Thereby, a flexible data stream encryption is achieved, wherein the degree of encryption can be freely selected such that the owner of a decoder who does not possess the key, still obtains a rough idea of the audio and/or video signal which might cause him to buy the key in order to hear or view the audio and/or video signal in its full quality. The encoder-specific encryption and decryption concept can be implemented into already existing encoders/decoders with little effort.
